In this book there is so much to know for someone who is interested in setting up their own hydroponic system. There are actually 6 systems you can choose from. Each one starts from the simple to the more complicated with detailed procedures. The instructions for starting up were good. Fresh foods are always the most expensive commodity in the supermarket. I wonder how people got their options on quick and ready to do foods. But health problems is at risk unless, you learn how to make and cultivate a good harvest and produce! I am becoming addicted with planting so far, and hydroponics is my new favorite. Like the movie "The Martian", what would people do if their supply of food suddenly depletes? In Mars, vegetation does not exist. The protagonist in movie is a botanist, but how about you? Hydroponics is the method to grow vegetables without soil. Perhaps this is the right information for such a situation. Soil is used by nature to grow vegetation. During humanity's history, people have figured out a way to grow plants without the necessity of soil. A few areas where hydroponics excels at: Use of fertilization, use of space/location, less water, reduced insects, reduced disease, vegetation grows faster. On the other hand, some downsides are more expenses, use of electricity as opposed to nature and risk of molds. Nature is out of our control, and man made methods are in our control. A hydroponic garden is easy to begin. A small garden can be cultivated right at your home or apartment. Everything required to create a hydroponic garden successfully is covered here.
